

Switch to a New Generation

## WIRELESS ACCESS CONTROLLERS

Advanced AP management

Fast wireless access

Intelligent RF management

Advanced network security features

#### **WIDE RANGE OF ACCESS POINTS MANAGEMENT FEATURES**

Thanks to DCN Access Controllers you can centrally manage all DCN Access Points in the network. Access Controllers integrate: exact user control management, perfect RF management, security mechanisms, super QoS and seamless roaming providing advanced WLAN access control functions. All AC models have a complete layer 3 core switch function and powerful forwarding performance. A DCN Access Controller can be used as a wireless controller and a layer 3 core switch at the same time. It is not only the brain of the wireless network but also the data forwarding centre of the entire wireless network.

# HIGH-DENSITY ACCESS PORT, INTELLIGENT INTEGRATED CONTROL AND FORWARDING ARCHITECTURE

DCN Access Controllers adopt the wireless forwarding technology based on ASIC chipset. The port density and wireless throughput are the highest among similar AC products in the market. They support not only wireless forwarding but also switching, they forward all wireless and wired traffic by the same chipset. Thanks to the integrated control and forwarding architecture the devices support trunk mode deployment, which greatly reduces investment costs, improves network performance and enables easy network management.

#### **INTELLIGENT RF MANAGEMENT FEATURES**

provide an automatic power and channel adjustment function. They employ particular RF detection and management algorithms to obtain a better RF coverage effect. When the signals of an AP are interfered by strong external signals, the AP may automatically switch to an appropriate operating channel under the controlof the AC to avoid such interference, thereby guaranteeing wireless network communication. The system also supports wireless network blackhole compensation. When an AP in the network accidentally stops operating, the RF management function of the AC compensates the resulting blind area of signals so that the wireless network can still operate normally.

#### ACCESS POINTSPLUG-AND-PLAY

DCN smart APs are able to automatically discover the controllers. A wireless network function enables automatic configuration of the Access Point without the administrator's involvement. DCN smart APs support plug-and-play technology and zero configuration. The wireless AC undertakes all the management, control and configuration of the APs. Network administrators donot need to separately manage or configure a huge number of wireless APs. All actions, such as configuration, firmware upgrading and security policy updating, are performed uniformly under the control of the wireless AC.

### **MULTIPLE MANAGEMENT MODES**

DCN Access Controllers support various management modes such as command lines and web interface. They can be used to plan, deploy, monitor, and manage APs in the entire network centrally and efficiently. Thanks to DCN Access controllers administrators can monitor and manage the entire network by checking the working status of APs and online users, planning RF resources in the entire network, locating users, generating security alarms, checking link loads, device usage and supporting an advanced wireless AC cluster technology to provide seamless roaming, to guarantee the continuity of real-time mobile services.
